Smoke Alarm

MAINS POWERED 230V~
9V Alkaline Battery Back-Up

Residents Guidelines for the SAFE use of Apartment Smoke Detectors

Operation

The green indicator will illuminate to show mains power is present

The red indicator will flash rapidly to show an alarm condition for the smoke detector

The "Test/Hush" button will either silence false alarms or perform a unit self-test.

In "Hush" mode the alarm enters a ten minute period of reduced sensitivity to overcome false alarm conditions, and will then automatically reset itself.

When interconnected to other Ei mains powered alarms, an alarm on one detector will trigger all other interconnected alarms within one second (only the triggered alarm will flash a red indicator)

The smoke detector will emit a beep every 40 seconds to indicate that the battery back-up is depleted and needs recharging. In this instance please replace the battery pack straight away.

If an alarm is to trigger and it is NOT an emergency please press and hold the 'HUSH' button until the alarms stops.

DO NOT REMOVE THE ALARM FROM ITS FIXED POSISTION.

Alarm models may vary from Apartment to Apartment, however they all should operate in a similar manner. Please ensure your Smoke Detector is in working order and you do know how to operate it.
